

VMT Customization Requirements

The VMT process can be done using vector files or image Files (Raster Files)

Raster Files

- Photos
- Organic Patterns (woods, stones)

File types: TIFF, PNG or JPG

- Real-size image at 300dpi - Maximum quality for graphics and colors
- Real-size image at 150dpi - Good quality for graphics and color gradient
- Real-size image at 72dpi - Low/medium quality for graphics and color gradient

Vector Files

- Solid Colors
- Geometric Patterns

File types: PDF, AI or EPS

VMTs can be produced using colors from the RAL or PANTONE catalog as a reference (there may be some deviations either due to the colors themselves or due to the base material used to produce the panels).

Notes

- When an image is divided between several Flat panel VMT, there may occur a slight misalignment between the images on each of the panels.
- A slight color variation may occur between different batches of VMT.
- Please assure that you own the right to the pattern/graphics and/or obtained a license to use it.
- Pay attention to the proportion of the images in relation to the dimensions of the desired panel.
- If the original image has poor quality, increasing its resolution in an image editing program is not going to help. This will only highlight the image's defects and pixels.
